

Using Putty

Introduction

For Windows:

There are several programs available that work for SSH. One of the most popular and easiest to use is "Putty".

Download :

http://telecharger.01net.com/windows/Internet/serveur_ftp/fiches/20166.shtml

Procedure

1- Launch Putty

2- Host Name (or IP adress)

Enter : `xxlplan.ovh.net` or the IP correspondant for your website or your_domain.tld

Caution !!

This option is only available for the 720PLAN/PACK and XXLPLAN/PACK offers.

720Plan/Pack => 213.186.33.16

XXPlan/Pack => 213.186.33.18

3- Check/Click on SSH

4- Click on the Open button

5- Enter your logi

6- Press the Enter button on your keyboard.

7- Enter your ftp password

8- Press the Enter button on your keyboard.

9- You will see the following message:

Hello,

Starting programs on the background is PROHIBITED !

All activities linked with IRC (bounce, irc, etc) are PROHIBITED!

You must stay in your directory. Do not read/open the system files.

Your account is under surveillance and in any case where you break any of these rules, your account will be immediately suspended !

If you launch a dump in the sql database and if you exceed the usage limits of the server, you will receive an alert to your `webmaster@` `postmaster@`.

If you are developing programs with C: you must work on a server that runs redhat 6.2 with glibc 2.1.3. version GCC of egcs-2.91.66

Useful commands:

1. `ls -l`
2. `chmod 705`
